It is pivoted at the center and has a stem projecting from this point to which the hammer is fastened as shown. This hammer strikes the bells on either side when it moves to and fro. The two electromagnets are wound in the same direction so as to produce like poles. In operation, when the current flows in the direction indicated in fig. 3, 242, north poles are produced at the upper end of the electromagnets; these respectively repel and attract the n and s poles of the armature causing a swing of the stem to the left as shown. When the current reverses as in fig. 3, 243 the magnetism of the electromagnet is reversed and accordingly the south poles produced at the upper end respectively attract and repel the n and s poles of the armature, causing the stem to swing to the right as shown. Ques. Will the polarized bell just described work on a regular alternating current circuit of high frequency Ans. No. Ques. Why Ans. If the frequency be much greater than that of the Fig. 3, 241. --Elementary alternating current bell with permanent magnet armature. In construction the electromagnets are wound similarly, that is, in the same direction, so as to produce like poles which simultaneously repel and attract the armature ends. The operation is illustrated in figs. 3, 242 to 3, 244. ordinary hand operated telephone magneto, there will not be sufficient...
