With the introduction of a new clinical method, as is also the case with a new operative procedure, certain structures and relationships assume an increased importance and require a fresh description. In this paper I propose to recast our description of the structures which seem to me to be directly concerned in the production of the venous pulse - my account having reference only to the arrangement as found in the human body. I propose to deal not only with the normal but also with the disordered heart, using for this purpose the series of specimens sent to me for examination by Dr James Mackenzie. These hearts are of special value for the purpose of study, because Dr Mackenzie had kept accurate records of their action during many years prior to the death of the patient. The Position of the Jugular Bulb. - The right jugular bulb, from which a tracing of the venous pulse is usually taken, is situated farther from the sternal end of the clavicle than one expects.
